AJ629151

AJ629151

Sorghum bicolor partial gkaf gene for Gamma Kafirin, promoter and exon 1, cultivar M35-1.

AJ629151 AY294254

AJ629151.1 GI:44903473

Gamma Kafirin, gamma kafirin gene.
Sorghum bicolor (sorghum)
Sorghum bicolor (sorghum)
Eukaryota, Viridiplantae, Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnollophyta; Liliopsida; Poales; Poaceae; PACCAD clade; Panicoideae; Andropogoneae; Sorghum. Mishra,A.

Quality improvement of grain sorghum: molecular analysis of Quality improvement of sorghum and generation of putative cDNA kafirin promoter of sorghum and generation of putative cDNA for HMW glutenin gene of wheat Submitted (26-FEB-2004) Mishra A., Engineering, G B Pant Unversity, M Uttaranchal, INDIA Mishra, A.

grain composition;

The present sequence represents the promoter of the gamma-coixin gene. The promoter is used in the method of the intention. The specification describes a method of preparing a monocotyledonous plant (other than C sp.) expressing a selected gene. The method comprises transforming a plant cell with construct comprising a selected gene operably linked t Claim 32; Page 228-229; 238pp; English. plants with improved properties. New isolated Coix regulatory sequences, used for producing transgenic

They can be transformed with genes such as an insect resistance gene, a fungal disease resistance gene, a viral disease resistance gene, a bacterial disease resistance gene, a herbicide resistance gene, a gene affecting grain composition or quality, a nutrient utilization gene, a mycotoxin reduction gene, a male sterility gene, a selectable marker gene, a screenable marker gene, a negative selectable marker gene, a gene affecting plant agronomic characteristics, and an environment or stress resistance gene. The methods can also be used for producing transgenic dicot plants such as tobacco, tomato,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Coix promoter, and then regenerating a monocotyledonous plant which expresses the gene from the recipient cell. The method can be used to prevent gene silencing in a monocotyledonous plant. The methods can be used for transforming monocot plants such as rice, wheat, oats, barley,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              181

The present sequence represents a fragment of the gamma-coixin promoter.

CC The promoter is used in the method of the invention. The specification CC describes a method of preparing a monocotyledonous plant (other than Coix Sp.) expressing a selected gene. The method comprises transforming a CC plant cell with construct comprising a selected gene operably linked to a CC coix promoter, and then regenerating a monocotyledonous plant which CC expresses the gene from the recipient cell. The method can be used to coix grown to gene silencing in a monocotyledonous plant. The methods can be used for transforming monocot plants such as rice, wheat, oats, barley, crye, sorghum and maize. They can be transformed with genes such as an CC insect resistance gene, a fungal disease resistance gene, a viral disease resistance gene, a viral disease cresistance gene, a bacterial disease resistance gene, a herbicide cresistance gene, a bacterial disease resistance gene, a herbicide cresistance gene, a a mycotoxin reduction gene, a male sterility gene, a selectable marker gene, a screenable marker gene, a negative selectable marker gene, a gene affecting plant agronomic characteristics, and an environment or stress resistance gene. The methods can also be can deforting transgenic dicot plants such as tobacco, tomato, contato, soybean and cotton
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   믕
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δ

The present sequence represents a fragment of the gamma-coixin promoter. The promoter is used in the method of the invention. The specification describes a method of preparing a monocotyledonous plant (other than Coix sp.) expressing a selected gene. The method comprises transforming a plant cell with construct comprising a selected gene operably linked to a Coix promoter, and then regenerating a monocotyledonous plant which
                                                                                        Claim
                                                                                                                                                                                                                                                        14-MAY-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      expresses the gene from the recipient cell. The method can be used to prevent gene silencing in a monocotyledonous plant. The methods can be used for transforming monocot plants such as rice, wheat, oats, barley, rye, sorghum and maize. They can be transformed with genes such as an insect resistance gene, a fungal disease resistance gene, a viral disease resistance gene, a bacterial disease resistance gene, a herbicide resistance gene, a gene affecting grain composition or quality, a nutrient utilization gene, a mycotoxin reduction gene, a male sterility gene, a selectable marker gene, a screenable marker gene, a negative selectable marker gene, a gene affecting plant agronomic characteristics, and an environment or stress resistance gene. The methods can also be used for producing transgenic dicot plants such as tobacco, tomato, potato, soybean and cotton

CC pcmma-coixin gene for subsequent cloning. The amplified fragment is used coixin gene for subsequent cloning. The amplified fragment is used coix in the course of the invention. The specification describes a method of corpsparing a monocotyledonous plant (other than Coix sp.) expressing a construct comprising a selected gene operably linked to a Coix promoter, comprising a monocotyledonous plant which expresses the gene from then regenerating a monocotyledonous plant which expresses the gene coin a monocotyledonous plant. The methods can be used for transforming composed that such as rice, wheat, oats, barley, rye, sorghum and maize. They can be transformed with genes such as an insect resistance gene, a constant of the sease resistance gene, a constant of the sease resistance gene, a constant of the sease resistance gene, a mycotoxin reduction gene, a malativ, a nutrient utilization gene, a constant gene and selectable marker gene, a screenable marker gene, a megative selectable marker gene, a gene can be transformed characteristics, and an environment or stress contains and such as the contains and others.

The specification describes a method of preparing a CC monocotyledonous plant (other than Coix sp.) expressing a selected gene. CC The method comprises transforming a plant cell with construct comprising CC a selected gene operably linked to a Coix promoter, and then regenerating CC amonocotyledonous plant which expresses the gene from the recipient CC cell. The method can be used to prevent gene silencing in a CC monocotyledonous plant. The methods can be used for transforming monocot CC plants such as rice, wheat, oats, barley, rye, sorghum and maize. They CC can be transformed with genes such as an insect resistance gene, a fungal CC disease resistance gene, a viral disease resistance gene, a bacterial CC disease resistance gene, a viral disease resistance gene, a gene affecting CC grain composition or quality, a nutrient utilization gene, a mycotoxin CC reduction gene, a male sterility gene, a selectable marker gene, a gene CC affecting plant agronomic characteristics, and an environment or stress CC resistance gene. The methods can also be used for producing transgenic contracts to the producing transgenic contracts and the producing transgenic contracts to the producing transgenic contracts the pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

PCR primers AAZ45470-72 were used to amplify the promoter of the gamma-coixin gene for subsequent cloning. The promoter is used in the method of the invention. The specification describes a method of preparing a monocotyledonous plant (other than Coix sp.) expressing a selected gene. The method comprises transforming a plant cell with construct comprising a selected gene operably linked to a Coix promoter, and then regenerating a monocotyledonous plant which expresses the gene from the recipient cell. The method can be used to prevent gene silencing in a monocotyledonous plant. The methods can be used for transforming monocot plants such as rice, wheat, oats, barley, rye, sorghum and maize. They
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gamma-coixin protein; monocotyledonous plant; Coix promoter; gene silencing; rice; wheat; oat; barley; rye; sorghum; maize; insect resistance; fungal disease resistance; viral disease resistance; bacterial disease resistance; herbicide resistance; grain composition; nutrient utilization; mycotoxin reduction; male sterility;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          a monocotyledonous plant which expresses the gene from the recipient cell. The method can be used to prevent gene silencing in a monocotyledonous plant. The methods can be used for transforming monocot plants such as rice, wheat, oats, barley, rye, sorghum and maize. They can be transformed with genes such as an insect resistance gene, a fungal disease resistance gene, a viral disease resistance gene, a bacterial disease resistance gene, a herbicide resistance gene, a gene affecting grain composition or quality, a nutrient utilization gene, a mycotoxin reduction gene, a male sterility gene, a selectable marker gene, a screenable marker gene, a negative selectable marker gene, a negative selectable marker gene, a mycotoxin characteristics, and an environment or stress resistance gene. The methods can also be used for producing transgenic dicot plants such as tobacco, tomato, potato, soybean and cotton
                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated Coix regulatory sequences, used for producing transgenic plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI; 2000-126367/11.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
The invention relates to a new isolated peptide comprising a human G protein-coupled receptor (GPCR) appearing as ABG70854, its fragment (comprising at least 10 contiguous amino acids), orthologue or allelic variant, encoded by a nucleic acid molecule that hybridises to the opposite strand of a nucleic acid molecule appearing as ABS54620 (the gene) or ABS54621 (partial cDNA). Also included are an isolated antibody that selectively binds to the GPCR, a gene chip comprising the nucleic acids, a transgenic non-human animal, a nucleic acid vector, a host cell, and identifying modulators/binding agents of the GPCR or nucleic acid. The GPCR peptides, proteins, nucleic acid molecules and agents are useful for the development of human therapeutic targets, to aid in the identification of therapeutic proteins, and to serve as targets for the development of human therapeutic agents. The peptide may be used in drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 can be transformed with genes such as an insect resistance gene, a fungal disease resistance gene, a viral disease resistance gene, a bacterial disease resistance gene, a herbicide resistance gene, a gene affecting grain composition or quality, a nutrient utilization gene, a mycotoxin reduction gene, a male sterility gene, a selectable marker gene, a screenable marker gene, a negative selectable marker gene, a gene affecting plant agronomic characteristics, and an environment or stress resistance gene. The methods can also be used for producing transgenic resistance gene. The methods can also be used for producing transgenic
                                                                                                                                                                                                                                                                                      New isolated human G protein-coupled receptor (GPCR) developing therapeutic and diagnostic compositions fit treating a disease mediated by a GPCR protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; ds; gene; GPCR; G protein-coupled receptor; neuroleptic; antiparkinsonian; antimigraine; antiemetic; gastrointestinal; central nervous system disorder; schizophrenia; Parkinson's dismigraine; vomiting induced by cancer therapy; gastric motility

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC screening assays, in assays to determine the biological activity of the protein, to raise antibodies or to elicit another immune response, as a CC reagent in assays designed to quantitatively determine levels of the CC protein in biological fluids, or as markers for tissues in which the CC corresponding protein is preferentially expressed. The GPCR peptides are also useful for diagnosing a disease, predisposition to a disease, or CC treating a disorder characterised by an absence of, inappropriate or CC unwanted expression of the protein. These disorders include central CC nervous system disorders such as schizophrenia, Parkinson's disease, CC migraine, vomiting induced by cancer therapy and gastric motility CC disorders resulting from an alteration in function of dopamine and CC serotonin receptors. The antibodies are useful in pharmacogenomic CC analysis, for inhibiting protein function, or for tissue typing. The CC intermediates, as antisense constructs to control GPCR gene expression, CC or in biological assays. The present sequence is the GPCR gene

         The invention relates to a flea head and nerve cord (HNC) protein and a flea hindgut and malpighian tubule (HMT) protein. The invention also relates to an isolated nucleic acid molecule expressed by a tissue chose from a flea HMT tissue and a flea HMC tissue, identified by a method involving constructing a cDNA library enriched for HMT or HMC expressed sequences and identifying a nucleic acid molecule in the library, and an isolated antibody that selectively binds an HMC or HMT protein. The proteins are useful for identifying compounds capable of inhibiting activity of the proteins which involves contacting a protein with a putative inhibitory compound under conditions in which, in the absence of the compound, the protein has activity, and determining if the putative inhibitory compound inhibits its activity. The proteins, nucleic acids and series are activity of the state of the protein has activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Flea; head and nerve cord protein; HNC;

The invention relates to a polynucleotide having any of 6006 specific sequences (ABZ50888-ABZ56893), which are expressed by a fungus under specific culture conditions including one or more of eutrophic, oligotrophic, solid, early germination, alkaline, high temperature, low temperature or maltose culture or polynucleotides stringently hybridising to these sequences. The polynucleotides are useful for monitoring the progress of fermentation and the growth conditions of a fungus, especially of Aspergillus oryzae which is widely used in industrial fermentation. Also monitoring for fungal contamination. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      chemotherapeutic drugs. The proteins are useful for producing a recombinant protein vaccine to protect an animal from flea infestation. The antibodies are useful for passively immunising an animal in order to protect the animal from fleas, as tools to screen expression libraries and/or for recovering desired proteins from a mixture of proteins and other contaminants. The antibodies are also useful for targeting cytotoxic agents to fleas in order to directly kill such fleas. This sequence represents cDNA encoding a cat flea HMT protein of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly
                                                                                                                                                                                                                                                                            Claim 1;
                                                                                                                                                                                                                                                                                                                   Detection of expression fermentation and growth
                                                                                                                                                                                                                                                                                                                                                                                                                                     Takeuchi

                                                                                                         The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Probe; microarray; human; placenta; antenatal diagnosis; genetic disorder; ss.

                                                                                                                             The invention relates to a spatially-addressable set of single exon concleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the grobes with a collection of detectably labelled nucleic acids derived contacting the collection of detectably labelled nucleic acids derived contacting the measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They care useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for cassessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag conformation from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained con electronic format directly from WIPO at

Vitis rupestris 'A. de Serres' x V. spp. 'b42-26'
(8909-15) showing resistance to Xylella fastidiosa under
greenhouse experimental conditions (M. Andrew Walker and
Alan Krivanek, U.C. Davis). Samples were collected from
Alan Krivanek, U.C. Davis). Samples were collected from 17-week old greenhouse grown plants. cDNAs were made by oligo-dT priming and directionally cloned. 5' and 3' adaptors were used in cloning as follows: 5'-AACCAGTGGTATCAACGCAAGTGGCCAATTACGGCCGGG-3' and 5'-ATTCTAGAGGCCGAGGCCGACATG-dT(30)NN-3'. Library was constructed using the Clontech Creator SMART kit and Location/Qualifiers organism="Vitis hybrid clone="RR890915N0002\_IIIc\_Fc\_H08" mol\_type="mRNA" db\_xref="taxon:241073" Iandolino,A., Lim,H., Streptophyta; Embryophyta; Tracheophyta; yta; eudicotyledons; core eudicots; cultivar' USA mRNA linear EST 04-AUG-2003 RR890915N Vitis hybrid cultivar 5 5', mRNA sequence. Disease resistant Vitis sp Baek, J., Leslie, A., Χu, J., of.

/note="Site 1: Xba I; Site 2: Xba I; The vector was
digested with XbaI and one nucleotide was added by fill in
in the recessive 3' end. The genomic DNA was nebulized,
end repaired, adaptor ligated and size fractionated using
sephadex. The resulting fragments were between 0.8 and 3
kb and were cloned into the vector (.x/y reads in M13mp19)
.b/g reads in pUC19). The same ligation was transformed in
either JM107 or DH5a."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Bource
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Email: est@watson.wustl.edu
Cloned unidirectionally. Poly(A)+ RNA was concentrated and purified
using Dynabeads (Dynal) and mRNA eluted for first strand synthesis.
First strand cDNA was created using MMLV RT (Powerscript, Clontech)
and primed with oligo(dT) with XhoI site and 5'SMART 'anchor' added
using chimeric DNA-RNA oligo. 12 PCR cycles were done using first
strand and primers specific to SMART oligo and 3' end. Double
stranded cDNA was digested using XhoI/NoEI, fractioned on
Chroma-spin 400 columns (Clontech) and ligated to digested
pGEM-11zf(+) plasmid. Chemically competent DH10B cells were used as
host cells. Library materials provided by Dr. David Bird of North
Carolina State University. Library construction by Jeff Rousch. See

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                /clone lib="Meloidogyne arenaria J2 SMART pGEM"
/note="Vector: plasmid (ampicillin resistant); Site 1:
XhoI; Site 2: Noti; Cloned unidirectionally. Poly(A) + RNA
was concentrated and purified using Dynabeads (Dynal) and
mRNA eluted for first strand synthesis. First strand cDNA
was created using MMLV RT (Powerscript, Clontech) and
primed with oligo(dT) with XhoI site and 5'SMART 'anchor'
added using chimeric DNA-RNA oligo. 12 PCR cycles were
done using first strand and primers specific to SMART
oligo and 3' end. Double stranded cDNA was digested using
XhoI/Noti, fractioned on Chroma-spin 400 columns
(Clontech) and ligated to digested pGEM-11zf(+) plasmid.
Chemically competent DH10B cells were used as host cells.

Ancylostoma ceylanicum cDNA PCR products of size nucleotides containing SL1 on the 5' end and oligo(dT) on the 3' end were non-directionally cloned into pCR-XL-TOPO (Invitrogen) following the cloning protocol. The cDNA insert can be excised by digestion with EcoRI. The library was constructed by Dr. Vadim Kapulkin from the University of Colorado at Boulder."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (Atlanta, Georgia). Poly A+ RNA was separated from total C. parvum RNA using the Poly(A) Quik mRNA Isolation Kit from Stratagene. Directional CDNA was synthesized by first-strand priming with a Xho I-oligo d(T) linker-primer, second-stranding with RNase H and DNA polymerase I, ligation of EcoR I linkers, and digestion with Xho I, all using the Stratagene ZAP-CDNA synthesis kit. The cDNA was cloned into the EcoR I and Xho I sites of Lambda Uni-ZAP XR vector; the unamplified library was >95% recombinant and contained 3.8 X 10(6) independent clones. PCR analysis of 20 random clones indicated that

           Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DB 08

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
